Abstract

The Sap Business One (SBO) is an integrated ERP software that targets business software requirements of small and medium sized companies. During the software implementation, many times have to modify the business logic or have to make vertical or horizontal AddOn-s to manage the entire processes of companies. Integration can be achieved using SAP Business One Software Development Kit (SDK). In this presentation we describe our powerful software framework, which is good for fast development integrated SBO AddOn, and for making independent software too. Softwares developed with our framework could be running integrated to SBO and could be running independently.
